

48–Hour Lifeline: Earthquake Early Warning System

Code that Saves Lives: Speed, Reliability, and User-Centric Design.

In disaster management, latency is the enemy. Developed under the intense pressure of a 48-hour hackathon, this project delivers a critical Earthquake Early Warning System designed for immediate response.

Full-Stack Integration:

Engineered a high-performance Frontend interface coupled with robust RESTful APIs to fetch and display seismic data with millisecond-level precision.

Resilient Architecture:

Focused on ensuring system stability and data accuracy during high-traffic spikes typical of emergency situations.

UI/UX for Emergencies:

Prioritized accessibility and clarity in the design, ensuring that users can intuitively navigate the application and access life-saving information instantly during panic situations.
